

[DOCUMENT NAME] ABSTRACT

A hinge structure and a hinge structure member capable of relieving stress concentration around the connected portions of the hinge structure. The hinge structure comprises a pair of connection portions connected to the connected portions and an
5 elastically deformable hinge portion having both ends arranged continuously with the pair of connection portions so that the pair of the connected portions can be swingably connected to each other. At least one of the connection portions extends in a specified axial direction along the specified surface of the connected portions, and connected continuously with the surface over a specified length.
